

Nicht chronisch krank, sondern vergiftet?

Fallbeispiele für das Entgiften mit Biologo-Detox-Produkten

Mal ob Pferd, Hund oder Katz – unsere Tiere sind genau wie wir mit einer zunehmenden Belastung mit Umweltgiften ausgesetzt. Pferde freuen Paß, Salz und Kupferfütterer, die mit Schwefelblei aus Algen, Düngern und Pestiziden belastet in Heide und Kamm bekommen meist mit Konservierungsstoffen behaltene Futtermittel, in denen sich Blei und Cadmium befinden, das ebenfalls mit Schwefelblei belastet in Fleisch, Fisch, Geflügel oder Eier enthalten aber auch Hormone, Antibiotika...

Beim Pferd zeigt sich das Gift im Blutbild, bei der Katze im Urin, bei der Kuh im Milchzucker. Die Giftstoffe lagern sich in den Gelenken und Sehnen an und verursachen Schmerzen. Die Tiere werden chronisch krank, aber nicht chronisch vergiftet. Die Giftstoffe lagern sich in den Gelenken und Sehnen an und verursachen Schmerzen. Die Tiere werden chronisch krank, aber nicht chronisch vergiftet.

Die Biologo-Detox-Produkte sind ein wirksames Mittel zur Entgiftung. Sie wirken auf die Leber ein und unterstützen die Ausscheidung der Giftstoffe. Die Tiere werden wieder gesund und können wieder Freude an ihrer Tätigkeit finden.

Not chronically ill, but toxic?

Detox Case Studies With Biologo-Detox Products

Almost every doctor, conventional or alternative, is familiar with cases like this: chronic illness improve within short periods of time and come back again. But what happens when the first treatment is detox?

Horse, dog, cat – it doesn't matter. Our pets, just like us, are exposed to an ever-increasing load of environmental toxins. Horses eat roughage, juice and concentrated food which has been exposed to heavy metals through exhaust fumes, fertiliser and pesticides. Dogs and cats mostly eat food treated with preservatives to increase its shelf life, which includes mercury and heavy metals. Also, they are exposed to heavy metals through their environment.

Meat, fish, poultry and eggs can all contain hormones, antibiotics and traces of other medicines. Chlorine and plenty of other toxic metals flow through the tap water. On top of that, the majority of our pets are vaccinated, causing direct exposure to mercury.

Whatever circulates in the body eventually settles into fatty tissue and tendons. In addition Toxins are often created in the intestines due to undigested dietary protein. Bacteria, Viruses and fungal infections also release toxins throughout the body. Also traces of medicinal drugs and dyes from food or the environment are toxic for any organism.

Even with the World Health Organisation's ruling that environmental toxins are the most prominent cause of, or at the very least a co-factor for, chronic illness, traditional medicine continues to believe that the already heavily-polluted body should be given even more chemicals, in the form of medicinal drugs.

Dr. vet. Jenny Lohse from Munich believes the main problem to be such: "When I treat a completely contaminated organism with regulation medicines, such as acupuncture or homoeopathy, they just aren't effective." From her experience, it's important to start slowly with detox with animals that are heavily contaminated with environmental toxins, so that the already stressed organism isn't unnecessarily overworked.

Her observation: "Several detox products that I have used so far can in many cases induce a proper shock to the animals." In the past year she treated many horses, which were no longer able to be treated with regulation medicine, with products from the Biologo-Detox-Line (see box below). "Since my experience with other detox systems has made me very careful. I always start a treatment with the pure toxin binding agent Biologo-Rescue, which only binds and eliminates the daily exposures." That can sometimes be enough to obtain astounding results:

In the case of a 15-year old gelding who had been suffering for one and a half years from a chronic eye infection, one treatment with Biologo-Rescue with the recommended dosage for humans, followed with the homoeopathic treatments, was all it took for the eye to recover. This result had not been achieved with traditional medicine, homoeopathy or acupuncture. Another example is of a 16-year old gelding with multiple chronic illnesses – from skin issues to coughs – shows the effect of the removal of free toxins: the horse had been suffering from a bacterial skin infection since it was 10 years old.

An obvious suppression was followed by asthmatic coughs. The most noticeable symptoms were thrush on one of the rear hips which was already there before the skin infection, and an open wound on the ankle of the same leg. Two days after beginning a treatment with Biologo-Rescue, the open wound had closed and the thrush disappeared shortly afterwards. As soon as the detox remedy was stopped, both symptoms reappeared. A second treatment with Biologo-Rescue caused the same result. "If I want it to achieve a good outcome, metaphorically speaking, I have to first clean the house before I can hang up the artwork" – Dr. Lohse. "In cases of extreme toxin contaminations, elimination of the free radicals and the amount of environmental toxins exposed on a daily basis alone is just not enough.

After that, follow-up remedies come into play, for example Biolog-Detox: a remedy which releases and binds toxins. The great thing about the Biologo products is, in my opinion, the fact that they eliminate toxins via the intestines if taken correctly; meaning, it's not necessary to make sure the animal drinks enough water in order to safely detox via the kidneys.”

Another example is the case of a 16-year old gelding that suffered from chronic sinusitis since November 2008. At the beginning of the illness, doctors ruled out any dental issues or tumours – they couldn't find the cause of the sinusitis. From the beginning of the malady until April 2009, the horse had undergone a total of 5 antibiotic treatments. The sinuses were in fact cleaned out daily with a saline solution through a hole drilled into the bone. After discontinuing the accompanying anti-inflammatory drugs, the pusy nasal discharge was back within no time. The gelding went through a total of one and a half treatments of Biologo-Rescue and one acupuncture session. After only 3 days of an acute worsening, the nasal discharge ended and hasn't appeared since. The treatment was completed with declining doses of Biologo-Regulation.

The Biologo-Detox line of products (www.biologo-detox.com) were developed by Dr. Tim Ray, a world renowned pioneer in detox research.

Through a specific cold process, micronised organic-quality chlorella algae are combined with certified organic herbs. The process of micronisation not only gets rid of heavy metals, but simultaneously eliminates poisons and mycotoxins.

The contents in each and every detox product are specifically designed so that, if taken properly, no healing crises occur. Biologo-Rescue is a toxin binder, which hastily binds and eliminates freely circulating heavy metals, chemical toxins and mycotoxins in the blood, intestines and lymph nodes, without releasing deeply imbedded toxins.

The classic of the extensive 15 product Biologo line, Biologo-Detox, activates and binds toxins. Also part of the detox family are Biologo-Detox Forte and Biologo-Detox Cream.
